

OTTER LIFE

I can close my nose and ears as I submerge into the water

My body is long and slender, definitely hydrodynamic!

I use bubbles of water to smell underwater

To help me see underwater, I have a muscle around my eye that changes the curvature to adapt to underwater view

My coat is made of two layers, one thick and short, and one sparse and long, which makes it very warm and waterproof

My canines are strong and sharp; suitable to firmly grasp the prey and tear the meat that I've caught for my dinner

I have long whiskers called vibrissae which are able to feel every little vibration in the water and locate the prey with extreme precision

My tail is long, thick and strong, and I use it just like a rudder to change direction when I'm in the water

I have webbed feet to aid my aquatic lifestyle
